C-5 Modified Indazolytpyrrolotriazines

Field of the Invention

This invention relates to compounds that inhibit the tyrosine kinase activity of growth factor receptors such as HER1, HER2, and HER4 thereby making them useful as anti-cancer agents. The compounds are also useful in the treatment of diseases, other than cancer, which are associated with signal transduction pathways operating through growth factor receptors such as HER1, HER2 and HER4.

Background of the Invention

Receptor tyrosine kinases (RTKs) are important in the transmission of biochemical signals across the plasma membrane of cells. These transmembrane molecules characteristically consist of an extracellular ligand-binding domain connected through a segment in the plasma membrane to an intracellular tyrosine kinase domain.

The human epidermal growth factor receptor (HER) family consists of four distinct receptor tyrosine kinases referred to HER1, HER2, HER3, and HER4. These kinases are also referred to as erbB1, erbB2, etc. HER1 is also commonly referred to as the epidermal growth factor (EGF) receptor. With the exception of HER3, these receptors have intrinsic protein kinase activity that is specific for tyrosine residues of phosphoacceptor proteins. The HER kinases are expressed in most epithelial cells as well as tumor cells of epithelial origin. They are also often expressed in tumor cells of mesenchymal origin such as sarcomas or rhabdomyosarcomas. RTKs such as HER1 and HER2 are involved in cell proliferation and are associated with diseases such as psoriasis and cancer. Disruption of signal transduction by inhibition of these kinases would have an antiproliferative and therapeutic effect.

The enzymatic activity of receptor tyrosine kinases can be stimulated by either overexpression, or by ligand-mediated dimerization. The formation of homodimers as well as heterodimers has been demonstrated for the HER receptor family. An example of homodimerization is the dimerization of HER1 (EGF receptor) by one of the EGF family of ligands (which includes EGF, transforming growth factor alpha, betacellulin, heparin-binding EGF, and epiregulin).

Heterodimerization among the four HER receptor kinases can be promoted by binding to members of the heregulin (also referred to neuregulin) family of ligands. Such heterodimerization as involving HER2 and HER3, or a HER3/HER4 combination, results in a significant stimulation of the tyrosine kinase activity of the receptor dimers even though one of the receptors (HER3) is enzymatically inert. The kinase activity of HER2 has been shown to be activated also by virtue of overexpression of the receptor alone in a variety of cell types. Activation of receptor homodimers and heterodimers results in phosphorylation of tyrosine residues on the receptors and on other intracellular proteins. This is followed by the activation of intracellular signaling pathways such as those involving the microtubule associated protein kinase (MAP kinase) and the phosphatidylinositol 3-kinase (PI3 kinase). Activation of these pathways have been shown to lead to cell proliferation and the inhibition of apoptosis. Inhibition of HER kinase signaling has been shown to inhibit cell proliferation and survival.

Use and Utility

The present invention is based on the discovery that certain pyrrolotriazines are inhibitors of protein kinases. More specifically, pyrrolotriazines such as those
10 described in this invention inhibit the protein tyrosine kinase activity of members of the HER family of receptors. These inhibitors will be useful in the treatment of proliferative diseases that are dependent on signaling by one or more of these receptors. Such diseases include psoriasis, rheumatoid arthritis, and solid tumors of the lung, head and neck, breast, colon, ovary, and prostate. The invention relates to a
15 pharmaceutical composition of compound of formula I, or pharmaceutically acceptable salt or hydrate thereof, and a pharmaceutically acceptable carrier in the treatment of hyperproliferative disorder in mammal. In particular, the said pharmaceutical composition is expected to inhibit the growth of those primary and recurrent solid tumors which are associated with HER1 (EGF receptor) and HER2, especially those tumors which are significantly dependent on HER1 or HER2 for their
20 growth and spread, including for example, cancers of the bladder, squamous cell, head, colorectal, oesophageal, gynecological (such as ovarian), pancreas, breast, prostate, vulva, skin, brain, genitourinary tract, lymphatic system (such as thyroid), stomach, larynx and lung. In another embodiment, the compounds of the present
25 invention are also useful in the treatment of noncancerous disorders such as psoriasis and rheumatoid arthritis.

Thus according to a further aspect of the invention there is provided the use of a compound of the formula I, or a pharmaceutically acceptable salt thereof in the manufacture of a medicament for use in the production of an antiproliferative effect in

a warm-blooded animal such as a human being.

According to a further feature of the invention there is provided a method for producing an antiproliferative effect in a warm-blooded animal, such as a human being, in need of such treatment which comprises administering to said animal an effective amount of a compound of formula I or a pharmaceutically acceptable salt thereof as defined herein before.

By virtue of their ability to inhibit HER1, HER2, and HER4 kinases, compounds of the present invention can be used for the treatment of proliferative diseases, including psoriasis and cancer. The HER1 receptor kinase has been shown to be expressed and activated in many solid tumors including head and neck, prostate, non-small cell lung, colorectal, and breast cancer. Similarly, the HER2 receptor kinase has been shown to be overexpressed in breast, ovarian, lung and gastric cancer. Monoclonal antibodies that downregulate the abundance of the HER2 receptor or inhibit signaling by the HER1 receptor have shown anti-tumor efficacy in preclinical and clinical studies. It is therefore expected that inhibitors of the HER1 and HER2 kinases will have efficacy in the treatment of tumors that depend on signaling from either of the two receptors. In addition, these compounds will have efficacy in inhibiting tumors that rely on HER receptor heterodimer signaling. These compounds are expected to have efficacy either as single agent or in combination (simultaneous or sequentially) with other chemotherapeutic agents such as Taxol, adriamycin, and cisplatin. Since HER1 and HER2 signaling has been shown to regulate expression of angiogenic factors such as vascular endothelial growth factor (VEGF) and interleukin 8 (IL8), these compounds are expected to have anti-tumor efficacy resulting from the inhibition of angiogenesis in addition to the inhibition of tumor cell proliferation and survival. The HER2 receptor has been shown to be involved in the hyperproliferation of synovial cells in rheumatoid arthritis, and may contribute to the angiogenic component of that inflammatory disease state. The inhibitors described in this invention are therefore expected to have efficacy in the treatment of rheumatoid arthritis. The ability of these compounds to inhibit HER1 further adds to their use as anti-angiogenic agents. The antiproliferative treatment defined herein before may be applied as a sole therapy or may involve, in addition to a compound of the invention, one or more other substances and/or treatments. Such conjoint treatment may be achieved by way of the simultaneous, sequential or separate administration of the individual components of the treatment. The compounds of this invention may also be useful in combination with known anti-cancer and cytotoxic agents and treatments, including radiation. If formulated as a fixed dose, such combination products employ the compounds of this invention within the dosage range described below and the other pharmaceutically active agent within its approved dosage range. Compounds of formula I may be used sequentially with known anticancer or cytotoxic agents and treatment, including radiation when a combination formulation is inappropriate.

In the field of medical oncology it is normal practice to use a combination of different forms of treatment to treat each patient with cancer. In medical oncology the other component(s) of such conjoint treatment in addition to the antiproliferative treatment defined herein before may be: surgery, radiotherapy or chemotherapy. Such chemotherapy may cover three main categories of therapeutic agent:

- (i) antiangiogenic agents that work by different mechanisms from those defined hereinbefore (for example, linomide, inhibitors of integrin $\alpha v \beta 3$ function, angiostatin, razoxin);
- (ii) cytostatic agents such as antiestrogens (for example tamoxifen,

5 toremifen, raloxifene, droloxifene, iodoxifene), progestogens (for example megestrol acetate), aromatase inhibitors (for example anastrozole, letrozole, bora-zole, exemestane), anti-neoplastic hormonal agents, antiprogestogens, antiandrogens (for example flutamide, nilutamide, bicalutamide, cyproterone acetate), LHRH agonists and antagonists (for example gosereline acetate, luprolide), inhibitors of testosterone 5 α -dihydroreductase (for example finasteride), farnesyltransferase inhibitors, anti-invasion agents (for example metalloproteinase inhibitors like marimastat and inhibitors of urokinase plasminogen activator receptor function) and inhibitors of other growth factor function, (such growth factors include for example FGF, platelet derived growth factor and hepatocyte growth factor such inhibitors include growth factor antibodies, growth factor receptor antibodies, tyrosine kinase inhibitors and serine/threonine kinase inhibitors); and

10 (iii) antiproliferative/antineoplastic drugs and combinations thereof, as used in medical oncology, such as antimetabolites (for example antifolates like methotrexate, fluoropyrimidines like 5-fluorouracil, purine and adenosine analogues, cytosine arabinoside); Intercalating antitumour antibiotics (for example anthracyclines like doxorubicin, daunomycin, epirubicin and idarubicin, mitomycin-C, dactinomycin, mithramycin); platinum derivatives (for example cisplatin, carboplatin); alkylating agents (for example nitrogen mustard, melphalan, chlorambucil, busulphan, cyclophosphamide, ifosfamide nitrosoureas, thiotepan); antimitotic agents (for example vinca alkaloids like vincristine and taxoids like taxol, taxotere and newer microtubule agents such as

20 epothilone analogs, discodermolide analogs, and eleutherobin analogs); topoisomerase inhibitors (for example epipodophyllotoxins like etoposide and teniposide, amsacrine, topotecan); cell cycle inhibitors (for example flavopyridols); and biological response modifiers.

30 As stated above, the formula I compounds of the present invention are of interest for their antiproliferative effects. Such compounds of the invention are expected to be useful in a wide range of disease states including cancer, psoriasis, and

rheumatoid arthritis.

More specifically, the compounds of formula I are useful in the treatment of a variety of cancers, including (but not limited to) the following:

- 5 -carcinoma, including that of the bladder, breast, colon, kidney, liver, lung, including small cell lung cancer, esophagus, gall bladder, ovary, pancreas, stomach, cervix, thyroid, prostate, and skin, including squamous cell carcinoma;
- tumors of mesenchymal origin, including fibrosarcoma and rhabdomyosarcoma;
- 10 - tumors of the central and peripheral nervous system, including astrocytoma, neuroblastoma, glioma and schwannomas; and
- other tumors, including melanoma, seminoma, teratocarcinoma, and osteosarcoma.

Due to the key role of kinases in the regulation of cellular proliferation in general, inhibitors could act as reversible cytostatic agents which may be useful in the treatment of any disease process which features abnormal cellular proliferation, e.g., benign prostate hyperplasia, familial adenomatosis polyposis, neuro-fibromatosis, pulmonary fibrosis, arthritis, psoriasis, glomerulonephritis, restenosis following angioplasty or vascular surgery, hypertrophic scar formation and inflammatory bowel disease

The compounds of formula I are especially useful in treatment of tumors having a high incidence of tyrosine kinase activity, such as colon, lung, and pancreatic tumors. By the administration of a composition (or a combination) of the compounds of this invention, development of tumors in a mammalian host is reduced.

25 Compounds of formula I may also be useful in the treatment of diseases other than cancer that may be associated with signal transduction pathways operating through growth factor receptors such as HER1 (EGF receptor), HER2, or HER4.

The compounds of this invention may be formulated with a pharmaceutical vehicle or diluent for oral, intravenous or subcutaneous administration. The pharmaceutical composition can be formulated in a classical manner using solid or liquid vehicles, diluents and additives appropriate to the desired mode of administration. Orally, the compounds can be administered in the form of tablets,

capsules, granules, powders and the like. The compounds may be administered in a dosage range of about 0.05 to 200 mg/kg/day, preferably less than 100 mg/kg/day, in a single dose or in 2 to 4 divided doses.

Biological assays

5

HER1, HER2 or HER4 Kinase assays:

Compounds of interest were assayed in a kinase buffer that contained 20 mM Tris.HCl, pH 7.5, 10 mM MnCl₂, 0.5 mM dithiothreitol, bovine serum albumin at 0.1 mg/ml, poly(glu/tyr, 4:1) at 0.1 mg/ml, 1 μ M ATP, and 4 μ Ci/ml [γ -³³P]ATP. Poly(glu/tyr, 4:1) is a synthetic polymer that serves as a phosphoryl acceptor and is purchased from Sigma Chemicals. The kinase reaction is initiated by the addition of enzyme and the reaction mixtures were incubated at 26 °C for 1 h. The reaction is terminated by the addition of EDTA to 50 mM and proteins are precipitated by the addition of trichloroacetic acid to 5%. The precipitated proteins are recovered by filtration onto Packard Unifilter plates and the amount of radioactivity incorporated is measured in a Topcount scintillation counter.

15

For the preparation of recombinant HER1 and HER4, the cytoplasmic sequences of the receptors were expressed in insect cells as GST fusion proteins, which were purified by affinity chromatography. The cytoplasmic sequence of HER2 was subcloned into the baculovirus expression vector pBlueBac4 (Invitrogen) and was expressed as an untagged protein in insect cells. The recombinant protein was partially purified by ion-exchange chromatography.

20

The instant compounds inhibit HER1, HER2, and HER4 kinases with IC₅₀ values between 0.001 – 25 μ M. Preferred compounds have IC₅₀ values between 0.001 – 5.0 μ M. More preferred compounds have IC₅₀ values between 0.001 – 1.0 μ M. Most preferred compounds have IC₅₀ values between 0.001 – 0.1 μ M.

25

A HERG potassium channel assay may be used to screen compounds for HERG activity (see Caballero R, et al., *Direct Effects of Candesartan and Eprosartan on Human Cloned Potassium Channels Involved in Cardiac Repolarization*, Molecular Pharmacology, Vol. 59, No. 4, pp. 825-36, 2001). Accordingly, preferred compounds have lower HERG assay activity.

Methods of Preparation

Certain compounds of formula I may generally be prepared according to the following schemes and the knowledge of one skilled in the art. Supplemental preparation information may also be found in co-pending US patent application serial
5 number 09/573,829 filed May 18, 2000 and international application published under the Patent Cooperation Treaty (PCT), International Publication Number WO 00/71129, both herein incorporated by reference.

Scheme 1

wherein E is an ester group and X and X¹ are halogen

Step 1

The first step of **Scheme 1** is accomplished by treatment of a 3-methyl-1H-pyrrole-2-carboxylic acid ester **i** (T. D. Lash et al., J. Heterocyclic Chem., 1991, 28, 1671) with a base such as potassium t-butoxide or sodium hydride in an anhydrous solvent such as THF or DMF followed by an aminating reagent, such as O-(2,4-dinitro-phenyl)-hydroxylamine (T. Sheradsky, J. Heterocyclic Chem., 1967, 4, 413) or chloramine (I. P. Sword, J. Chem. Soc. C, 1971, 820) to give the pyrrolylamine **ii**.

Step 2

The pyrrolylamine **ii** is heated with excess formamide to give the pyrrolotriazinone **iii**.

Step 3

Compound **iii** is converted to a 4-halo-pyrrolotriazine **iv** by heating with the appropriate phosphorus oxyhalide, e.g., the 4-chloro-pyrrolotriazine is obtained by

heating **iii** with phosphorus oxychloride.

Step 4

Halogenation of the 5-methyl group of **iv** is affected by treatment with a halogenating agent such as a N-bromosuccinimide or sulfuryl chloride. The reaction is performed under an inert atmosphere such as N₂ in the presence of a catalyst such as dibenzoyl peroxide or 2,2'-azobisisobutyronitrile, or irradiation and gives the 4-halo-5-halomethyl-pyrrolotriazine **v**.

Step 5

Treatment of **v** with a thiol, a thiocarboxylic acid, water, an alcohol, a carboxylic acid, a primary or a secondary amine in the presence of a base such as NaHCO₃ or triethylamine in a solvent such as acetonitrile affords intermediate **vi** in Scheme 1.

Step 6

Treatment of **vi** with a 5-amino-indazole derivative at room temperature in the presence of a base such as NaHCO₃ or triethylamine in a solvent such as acetonitrile gives the final product **vii**. Heating **vi** with a 5-amino-indazole derivative in the absence of base also affords **vii**.

Scheme 2**Step 1**

- 5 Compound **vii** ($R = SR^2$) of Scheme 1 can be oxidized to the sulfoxide, **i** ($n = 1$), or the sulfone, **i** ($n = 2$), of Scheme 2 by treatment with the appropriate amount of an oxidizing agent such as *m*-chloroperbenzoic acid.

Step 2

- 10 The 5-aminomethyl derivative **ii** is obtained by heating the sulfoxide **i** ($n = 1$) or the sulfone ($n = 2$) in the presence of an excess of an alcohol or a primary or secondary amine.

Scheme 3

wherein L = leaving group

Step 1

- 5 The alcohol group in compound vii (R = OH) of Scheme 1 can be converted to a leaving group as in compound i of Scheme 3. A variety of leaving groups can be introduced, e.g, treatment with thionyl chloride gives the chloride i (L = Cl), treatment with methanesulfonic anhydride and diisopropylethylamine gives the methanesulfonate i (L = OSO₂Me), esterification with acetic anhydride in the presence of diisopropylethylamine gives the acetate i (L = OAc).
- 10

Step 2

- For very reactive leaving groups such as chloride or sulfonate, i is converted directly into compound ii of Scheme 3 by reaction with an alcohol or a primary or secondary amine in the presence of a base such as diisopropylethylamine without the isolation of i. For less reactive leaving groups such as carboxylates, i is heated with alcohols or a primary or secondary amines in the presence of a base such as diisopropylethylamine to give ii.
- 15

Scheme 4

wherein E = ester group

Step 1

5 The 5-methyl-4-oxo-3,4-dihydro-pyrrolo[2,1-f][1,2,4]triazine-6-carboxylic acid ester **i** (see WO 00/71129, herein incorporated by reference) can be saponified by treatment with a base such as an aqueous solution of LiOH and then acidified by treatment with an acid such as HCl to give the carboxylic acid **ii** of **Scheme 4**.

Step 2

10 The carboxylic acid **ii** is decarboxylated to give the 6H-pyrrolo[1,2-a]triazin-4-one **iii**. This can be accomplished under a variety of conditions, for example, by heating a mixture of **ii** in 85% H₃PO₄ at 110 °C.

Step 3

The ester **i** can be converted directly into **iii**, for example, by heating a mixture
15 of **i** in 85% H_3PO_4 at 110 °C.

Step 4

The 6H-pyrrolo[2,1-f][1,2,4]triazine-4-one **iii** can be converted into **iv** as outlined in Scheme

1.

5

Scheme 5

wherein E is an ester group and X and X¹ are halogen

Step1

- 10 Halogenation of the 5-methyl group of 4-halo-5-methyl-pyrrolo[2,1-f][1,2,4]triazine-6-carboxylic acid ester **i** (see WO 00/71129, herein incorporated by reference) can be effected by treatment of **i** with a halogenating agent such as a N-bromosuccinimide or sulfonyl chloride. The reaction is performed under an inert atmosphere such as N₂ in the presence of a catalyst such as dibenzoyl peroxide or 2,2'-
- 15 azobisisobutyronitrile, or irradiation and gives the 4-halo-5-halomethyl-pyrrolo[2,1-f][1,2,4]triazine **ii** of Scheme 5.

Step 2

Treatment of **ii** with a thiol, an alcohol, a primary or a secondary amine in the presence of a base such as NaHCO_3 or triethylamine in a solvent such as acetonitrile affords intermediate **iii**.

5 Step 3

Treatment of **iii** with a substituted 5-amino-indazole derivative in the presence of a base such as NaHCO_3 or triethylamine in a solvent such as acetonitrile gives **iv**.

Step 4

10 The ester **iv** can be saponified by treatment with a base such as an aqueous solution of LiOH and then acidified by treatment with an acid such as HCl to give the carboxylic acid **v** of **Scheme 5**.

Step 5

The carboxylic acid **v** of **Scheme 5** is decarboxylated by heating to give the final product **vi**.

- Methanesulfonyl chloride (0.034 mL, 4 equiv) was added to an ice an ice cooled solution of 5-[1,4]diazepan-1-ylmethyl-pyrrolo[2,1-f][1,2,4]triazin-4-yl)-[1-(3-fluoro-
- 20 benzyl)-1H-indazol-5-yl]-amine (35 mg, 0.074 mmole) and TEA (0.041 mL, 4 equiv) in DCM (2.5 mL). This was left stirring for 1 hr and then removed from the ice bath. After standing overnight, the reaction was diluted with DCM, washed with water, and dried (Na₂SO₄). Removal of the solvent followed by radial chromatography (2 mm silica gel plate employing gradient elution with DCM containing 0 to 2% MeOH)

afforded the title compound as an oil (22 mg, 54%); MS: 549 (M+H)⁺; HPLC Ret Time: 1.26 min (YMC Xterra ODS S7 C18, 3.0 x 50 mm column, 2 min gradient, 5 mL/min).

(57) Abstract: The present invention provides compounds of
formula I and pharmaceutically acceptable salts thereof. The
formula I compounds inhibit tyrosine kinase activity of growth
factor receptors such as HER1, HER2 and HER4 thereby mak-
ing them useful as antiproliferative agents. The formula I com-
pounds are also useful for the treatment of other diseases as-
sociated with signal transduction pathways operating through
growth factor receptors.
